

Amendment to the Claims

The following is a list of the claims of the application:

1. (previously presented) A cleaning system for swimming pools including in combination:

a recirculating pump system having a suction water inlet and a water outlet;

a pool having first and second ends and a bottom;

a suction return in the bottom of the pool;

a connection between the suction return and the suction inlet of the recirculating pump system;

at least one first rotatable cleaning head in the bottom of the pool for cleaning in a 360° circle;

at least one second rotatable cleaning head in the bottom of the pool between the at least one first cleaning head and the suction return for cleaning in only a substantially 180° arc directed substantially toward the suction return; and

means connected between the water outlet of the recirculating pump system and the at least one first cleaning head and the at least one second cleaning head for alternately delivering water from the outlet of the recirculating pump system to the at least one first cleaning head and the at least one second cleaning head.

2. (previously presented) The cleaning system according to claim 1 wherein the means for alternately supplying water to the at least one first rotatable cleaning head and the at least one second rotatable cleaning head includes a water distribution valve.
3. (original) The cleaning system according to claim 2 wherein the recirculating pump system delivers water from the water outlet thereof to the at least one first rotatable cleaning head for a first predetermined period of time and supplies water to the at least one second rotatable cleaning head for a second predetermined period of time.
4. (original) The cleaning system according to claim 3 wherein a plurality of first rotatable cleaning heads are located in the bottom of the pool for indexed cleaning in a 360° circle.
5. (previously presented) The cleaning system according to claim 4 further including a plurality of second rotatable cleaning heads in the bottom of the pool between each of the plurality of first rotatable cleaning heads and the suction return for cleaning in only a substantially 180° arc directed toward the suction return.
6. (previously presented) The cleaning system according to claim 1 wherein the suction return is a drain and further including at least one additional first

rotatable cleaning head in the bottom of the pool for cleaning in a 360° circle;
and

further including at least one additional second rotatable cleaning head
in the bottom of the pool between the additional first cleaning head and the
drain for cleaning in only a substantially 180° arc directed substantially toward
the drain;

wherein the water outlet of the recirculating pump system further is
connected to the additional first and additional second cleaning heads for
alternately delivering water from the outlet of the recirculating pump system to
the additional first cleaning head and the additional second cleaning head.

7. (original) The cleaning system according to claim 6 wherein the first
rotatable cleaning heads are located near first and second opposite ends of the
pool and the second rotatable cleaning heads are located intermediate the first
rotatable cleaning heads and the drain of the pool.

8. (original) The cleaning system according to claim 1 wherein a plurality of
first rotatable cleaning heads are located in the bottom of the pool for indexed
cleaning in a 360° circle.

9. (previously presented) The cleaning system according to claim 8 further
including a plurality of second rotatable cleaning heads in the bottom of the
pool between the plurality of first cleaning heads and the suction return in the

pool for cleaning in only a substantially 180° arc directed toward the suction return in the pool.

10.-11. cancelled

12. (previously presented) A cleaning system for swimming pools including in combination:

a recirculating pump system having a suction water inlet and a water outlet;

a pool having a suction return;

a connection between the suction return and the suction water inlet of the recirculating pump system;

at least one first rotatable cleaning head in the pool for cleaning in a substantially 360° circle;

at least one second rotatable cleaning head in the pool between the at least one first cleaning head and the suction return for cleaning only in substantially a part-circle arc directed substantially away from the at least one first cleaning head and directed substantially toward the suction return; and

means connected between the water outlet of the recirculating pump system and the at least one first cleaning head and the at least one second cleaning head for alternately delivering water from the outlet of the recirculating pump system to the at least one first cleaning head and the at least one second cleaning head.

13. (original) The cleaning system according to claim 12 wherein said at least one second rotatable cleaning head indexes reversibly back-and-forth within said substantially part-circle arc.

14. (original) The cleaning system according to claim 12 wherein the means for alternately supplying water to the at least one first rotatable cleaning head and the at least one second rotatable cleaning head includes a water distribution valve.

15. (original) The cleaning system according to claim 14 wherein the means for alternately supplying water to the at least one first rotatable cleaning head and the at least one second rotatable cleaning head further includes a programmable control for programmably selecting the period of time said at least one first and second rotatable cleaning heads are respectively supplied with water from the outlet of said recirculating pump system.

16. (original) The cleaning system according to claim 12 wherein the recirculating pump system delivers water from the water outlet thereof to the at least one first rotatable cleaning head for a first predetermined period of time and then supplies water to the at least one second rotatable cleaning head for a second predetermined period of time.

17. (original) The cleaning system according to claim 12 wherein said pool further includes a bottom, and further wherein said at least one first rotatable cleaning head and said at least one second rotatable cleaning head are located in said pool bottom.

18. (original) The cleaning system according to claim 12 wherein said at least one first rotatable cleaning head comprises a plurality of first rotatable cleaning heads located in the pool each for indexed cleaning in a substantially 360° circle.

19. (previously presented) The cleaning system according to claim 18 wherein said at least one second rotatable cleaning head comprises a plurality of second rotatable cleaning heads located in the pool respectively between each of the plurality of first rotatable cleaning heads and the suction return for indexed cleaning in only a substantially part-circle arc directed substantially away from the associated one of said plurality of first cleaning heads and directed substantially toward the suction return.

20. (original) The cleaning system of claim 19 wherein said pool further includes a bottom, and further wherein said plurality of first and second cleaning heads are located in said pool bottom.

21. (previously presented) The cleaning system of claim 20 wherein said suction return is located in said pool bottom.
22. (original) The cleaning system according to claim 20 wherein the first rotatable cleaning heads are located near first and second opposite ends of the pool and the second rotatable cleaning heads are located intermediate the first rotatable cleaning heads and the suction return of the pool.
- 23.-24. cancelled
25. (new) A cleaning system for swimming pools including in combination:
 - a recirculating pump system having a suction water inlet and a water outlet;
 - a pool having first and second ends, a bottom, and a return inlet;
 - a suction return in the bottom of the pool;
 - a connection between the suction return and the suction inlet of the recirculating pump system;
 - at least one first rotatable pop-up cleaning head in the bottom of the pool for cleaning in a 360° circle;
 - at least one second rotatable pop-up cleaning head in the bottom of the pool between the at least one first rotatable pop-up cleaning head and the suction return for reversibly cleaning in only a substantially 180° arc directed substantially toward the suction return;

means, comprising a water distribution valve connected between the water outlet of the recirculating pump system and the at least one first rotatable pop-up cleaning head and the at least one second rotatable pop-up cleaning head, for alternately delivering water from the outlet of the recirculating pump system to the at least one first rotatable pop-up cleaning head and the at least one second rotatable pop-up cleaning head; and

means, comprising a valve positioned between the water outlet of the recirculating pump system and the water distribution valve, for ceasing water flow to the water distribution valve so as to bypass it in favor of directing the water flow to the return inlet.
